

Open-Source LLM Benchmarking: A Community Effort

Tom Brown^{12*}, Jane Doe²

Abstract

We present a novel approach combining attention mechanisms with graph neural networks for improved molecular property prediction. Experiments on standard benchmarks demonstrate state-of-the-art performance across multiple datasets.

1 Introduction

Deep learning has transformed many areas of scientific computing. In this paper we propose a unified framework that addresses key limitations of prior work. Our contributions are: (1) a novel architecture, (2) improved training procedure, (3) comprehensive benchmarks.
